シュミレーション実習中向Report 462201139 森 祐二郎

第1向 Buffon o針

(1) う軸との角度がみの時、な軸と交り3のす。

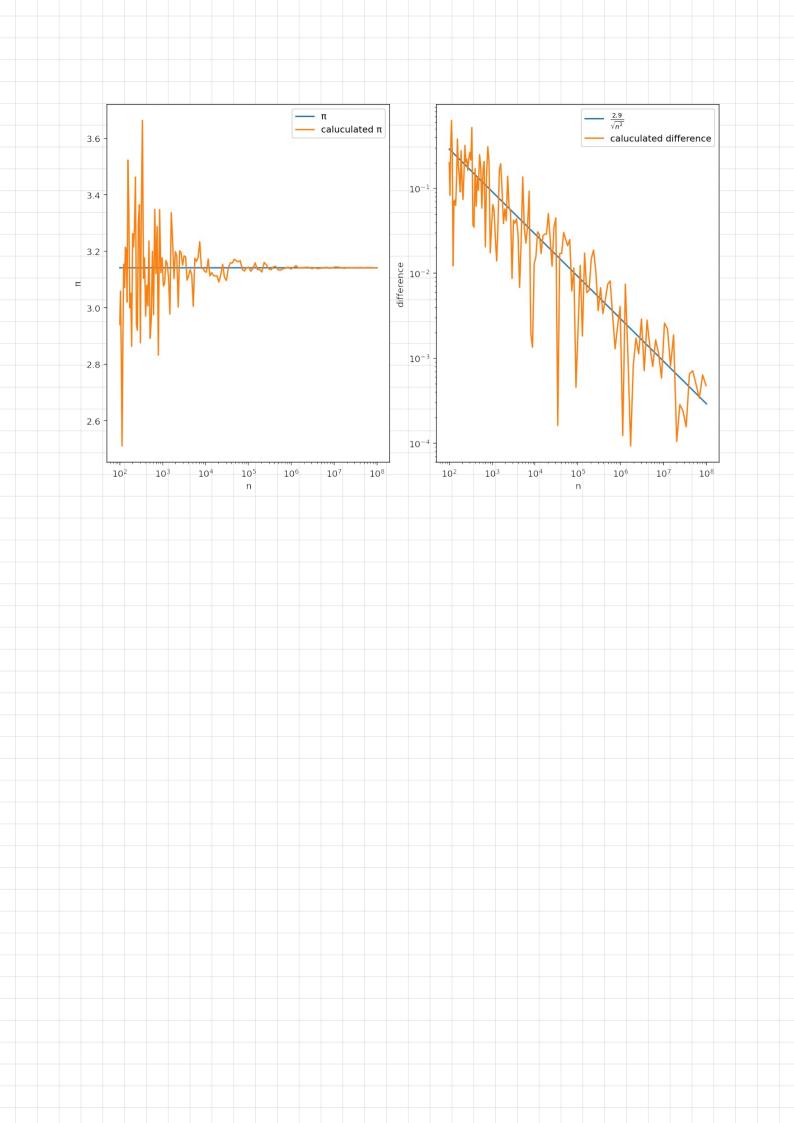

多s 上皇 cord の母 tr ので、交为3 腹坑で

よので. 棒状直線に交わる条件Pは.

$$P = \frac{\int_{0}^{\frac{1}{2}} \frac{1}{2} \cos \theta \, d\theta}{\pi \cdot \frac{1}{2}} = \frac{2l}{\pi d}$$

d=2, l=1とい計算した

$$m \ddot{\chi}(t) = -3 \dot{\chi}(t) - k \chi(t) \cdots (t)$$

$$m\lambda^2 + 5\lambda + k = 0$$

$$2 = \frac{-\xi \pm \sqrt{\xi^2 - 4km}}{2m}$$

$$\lambda_{\pm} = \frac{-5 \pm \sqrt{5^2 - 4 \times m}}{2m} < 0$$

$$x = C_1 \exp(\lambda_1 t) + C_2 \exp(\lambda_2 t)$$

$$R = \frac{-5 \pm i\sqrt{4km - 5^2}}{2m}$$

$$\mathcal{K} = A \exp\left(-\frac{5}{2m}t\right) \cos\left(\frac{\sqrt{4km-5^2}}{2m}t\right)$$

この日等. (本) は、
$$\left(\frac{d}{dt} + \frac{5}{2m}\right)^2 \chi = 0$$

$$\left(\frac{d}{dt} + \frac{5}{2m}\right) x = 0$$
 9 PA = 17. $\exp\left(-\frac{5}{2m}t\right)$

$$\left(\frac{d}{dt} + \frac{9}{2m}\right)^2 x = 0 \text{ or } \frac{3}{12} \approx 17. \text{ texp}\left(-\frac{9}{2m}t\right)$$

王考人3と、一般解は.

$$x = (G + G) exp \left(-\frac{5}{2m} + \right)$$

これは、臨界減衰である.

$$\frac{d}{dt} \widetilde{u} = -\frac{\xi t_0}{m} \widetilde{u} - \frac{t_0^2 k}{m} \widetilde{x}$$

これを離散化すると.

$$= \mathcal{X}(\mathcal{X}) + \mathcal{X}(\mathcal{X}) \left(1 - \frac{5t}{m} \Delta \mathcal{X}\right) \Delta \mathcal{X}$$
$$- \frac{t^2k}{m} \mathcal{X}(\mathcal{X}) (\Delta \mathcal{X})^2$$

(3)
$$t_d = \frac{m}{3}$$
, $t_s = \sqrt{\frac{m}{k}} \ge 13 \ge$.

$$\begin{cases} \widetilde{\alpha}(7+\Delta 7) = \widetilde{\alpha}(7)(1-\frac{t_0}{t_0}\Delta \widetilde{\tau}) - \frac{t_0^2}{t_0^2}\widetilde{\alpha}(7)\Delta \widetilde{\tau} \\ \widetilde{\alpha}(7+\Delta 7) = \widetilde{\alpha}(7) + \widetilde{\alpha}(7)(1-\frac{t_0}{t_0}\Delta 7)\Delta \widetilde{\tau} \\ - \frac{t_0^2}{t_0^2}\widetilde{\alpha}(7)(\Delta \widetilde{\tau})^2 \end{cases}$$

$$\begin{cases} \widetilde{v}(\tau+\Delta\tau) = \widetilde{v}(\tau)(1-\frac{t}{t}\Delta\tau) - \widetilde{x}(\tau)\Delta\tau \\ \widetilde{x}(\tau+\Delta\tau) = \widetilde{x}(\tau) + \widetilde{v}(\tau)(1-\frac{t}{t}\Delta\tau)\Delta\tau \\ - \widetilde{x}(\tau)(\Delta\tau)^2 \\ = 2^{\circ}, \quad 3^2 - 4km \neq 0 \quad 0 \quad \text{f.} \quad \text{f.} \quad \text{i.} \end{cases}$$

$$\frac{t_0}{t_d} = \int \frac{M}{k} \cdot \frac{3}{m} = \int \frac{5^2}{km} \stackrel{>}{<} 2 \quad k = 0.$$

無次元パラノーケーの条件に書き込みられる。 数値計算を古ってこのか,2.0,3.5で行,た.
